

Name:Ebisi chinecherem Leonard
Reg number:NS/CSC/22/7428
Level:2001
Course title:Csc223 Assignment
Date 27/07/2024
Answer 5 questions only
Number 1

1a

Tags Used to Create a Table in HTML:<table>: Defines the start and end of a table.<tr> (Table Row): Used to create rows within a table.<th> (Table Header): Defines the header cells in the table, usually bold and centered by default.<td> (Table Data): Defines the standard cells in the table.<caption>: Provides a title or caption for the table.<thead>: Groups the header content in a table.<tbody>: Groups the body content in a table.<tfoot>: Groups the footer content in a table.<col> and <colgroup>: Used to define column properties for entire columns, like width.

1(b)

Linking in HTML:Link to Another Web Page:Link Text: This tag creates a hyperlink to another web page. The href attribute contains the URL of the destination page.Example: Visit Example.Link Within a Page:Link Text: This tag links to a specific section within the same page. The href attribute contains the ID of the target element prefixed with a #.Example: Go to Contact Section and the target section could have <h2 id="contact">Contact Us</h2>.

Number 2

a. To start a new paragraph in HTML, use the <p> tag.b. To insert a new line in HTML, use the
 tag.c. To add blank spaces in HTML, use the character.d. To create headings in HTML, use the <h1> to <h6> tags, with <h1> being the largest and <h6> the smallest.

Number 3

3(a).

Steps to Display a Web Page in a BrowserURL Entry:The user enters a URL (Uniform Resource Locator) in the browser's address bar (e.g., www.example.com).DNS Lookup:The browser contacts a DNS (Domain Name System) server to resolve the domain name (e.g., www.example.com) into an IP address. The IP address is the server's address where the website is hosted.HTTP Request:The browser sends an HTTP (Hypertext Transfer Protocol) or HTTPS (HTTP Secure) request to the server associated with the IP address. The request includes the details of the page that the browser wants to retrieve (e.g., GET /index.html).Server Processing:The web server receives the request and processes it. If the requested resource is found, the server sends back an HTTP response with the requested files (like HTML, CSS, JavaScript, images).Rendering:The browser receives the HTML content, parses it, and processes linked resources like CSS (for styling) and JavaScript (for interactivity). The browser also requests any additional resources (images, fonts, etc.) from the server.Displaying the Web Page:The browser renders the HTML, applies the CSS styles, executes JavaScript, and displays the fully assembled web page to the user.

3(b).

DefinitionsDomain Name:A domain name is a human-readable address used to identify a website on the internet. It is part of the URL and is easier to remember than numerical IP addresses. Examples include google.com, example.org,

etc.**IP Address:**An IP address (Internet Protocol address) is a unique string of numbers separated by periods (IPv4) or colons (IPv6) that identifies each device connected to a network. It serves as a locator for a device on the internet, allowing computers to communicate with each other. For example, 192.168.1.1 (IPv4) or 2001:0db8:85a3:0000:0000:8a2e:0370:7334 (IPv6).

Number 4

Here's a sorted discussion of Net Surfing, Internet, and Web Browsing:1.

A. Internet**Definition:** The Internet is a vast global network of interconnected computers that allows the exchange of data and communication. It consists of various smaller networks, including those in businesses, schools, and governments, all connected via various communication channels like cables, satellites, and wireless connections.**Functionality:** The Internet enables various services like email, file sharing, and accessing web pages. It's the backbone that supports the web, online games, social media, and much more.**Components:****Servers:** Computers that host websites, store data, and provide services.**Clients:** Devices like computers, smartphones, and tablets that access data from servers.**Protocols:** Set of rules, like TCP/IP, HTTP, and FTP, that govern how data is transmitted across the network.

B. Web Browsing**Definition:** Web browsing is the activity of accessing and navigating the World Wide Web (WWW) using a web browser (e.g., Chrome, Firefox, Safari).**Functionality:** Users enter a URL (Uniform Resource Locator) or use a search engine to find web pages. The browser sends requests to the appropriate server and displays the content (text, images, videos, etc.) on the user's device.**Key Concepts:****Web Browser:** Software application that interprets HTML and other web technologies to display websites.**Web Pages:** Documents written in HTML, accessible via the web, containing content and links to other pages.**Hyperlinks:** Clickable links that navigate users to other web pages or websites.

C. Net Surfing**Definition:** Net surfing, also known as web surfing, is the casual and often random exploration of the Internet. It involves moving from one webpage to another, usually by following links, without a specific goal or direction.**Functionality:** Net surfing allows users to discover new information, entertainment, or resources without a focused search. It's often driven by curiosity, where one webpage leads to another, creating a chain of exploration.**Key Concepts:****Spontaneous Browsing:** Moving from one site to another without a pre-planned route.**Search Engines:** Tools like Google or Bing that help users start their surfing by providing search results.**Bookmarks:** Saving interesting pages for future reference during surfing sessions

Ways to Include CSS in a Web

Page**Inline CSS:****Description:** CSS styles are added directly within HTML elements using the style attribute.**Example:** <p style="color: blue; font-size: 16px;">This is a paragraph.</p>**Use Case:** Best for applying styles to individual elements without affecting others.**Internal CSS:****Description:** CSS styles are placed within a <style> tag in the <head> section of the HTML document.**Example:**<html>

<head>

<style>

body {

background-color: lightgrey;

}

h1 {

color: navy;

margin-left: 20px;

}

</style>

```
</head>i
<body>
  <h1>This is a heading</h1>
</body>
</html>Use Case: Suitable for styling a single page with specific styles.
External CSS:Description: CSS styles are written in a separate .css file and
linked to the HTML document using the <link> tag.Example:<html>
<head>
  <link rel="stylesheet" type="text/css" href="styles.css">
</head>
<body>
  <h1>This is a heading</h1>
</body>
</html>/* styles.css */
body {
  background-color: lightgrey;
}
h1 {
  color: navy;
  margin-left: 20px;
}
```
